1. Product overview

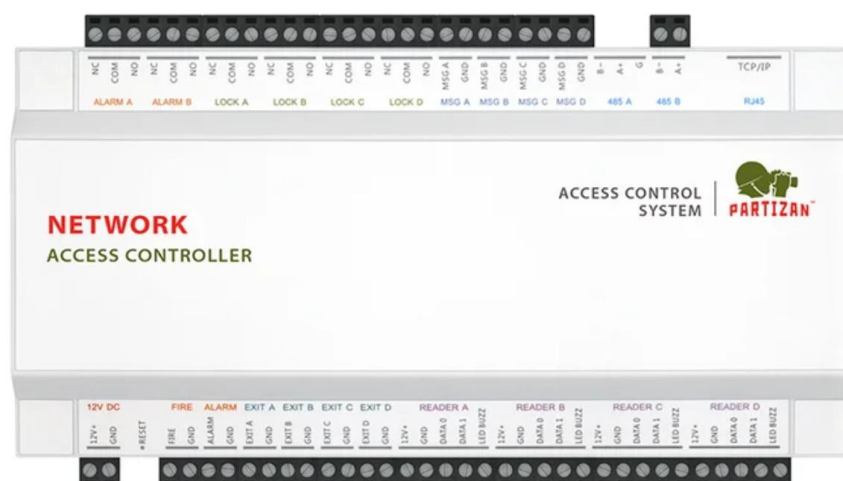

Fig.1. PAC-42.NET v1.0

The PAC-42.NET is a reliable network access controller built for managing locks, turnstiles, and other access control actuators across multiple doors. It combines high-capacity user and event storage with remote monitoring via a built-in web interface, making it suitable for medium to large-scale access control deployments.

Designed with safety in mind, the controller supports fire alarm integration for automatic emergency door unlocking. Its rugged housing and wide operating temperature range make it well-suited for demanding installation environments, and it is backed by an extended manufacturer warranty for long-term reliability.

For detailed information on programming the controller using Partizan Access Control Management software, please refer to the product page on the official website: <https://www.partizanstore.eu>
